

PREVENT FIRES, PROTECT THE HOME

Bedroom Safety

Have Arc Fault Circuit Interrupters (AFCIs) installed to safeguard against arc-faults, which could cause a fire.

If using a heating pad or electric blanket, do not place anything on top of them and don't leave them on unattended or while sleeping.

Do not sleep with devices that are charging, such as phones, under your pillow.

Tamper Resistant Receptacles (TRRs) should be installed in all bedrooms. This device allows only plugs to be inserted while preventing access to foreign objects, like hairpins.

Never leave a space heater unattended. Turn it off when you're leaving a room or going to sleep.

Never wrap or bundle cords together. This prevents the heat from dissipating, leading to a fire hazard.
